MELBOURNE, FLORIDA – June 29th, 2009. SkyView Software Development, LLC, a leader in Google EarthTM based RF Mapping tools, announced today the commercial release of their new **SkyView MicrowaveTM** & Broadband Engineering Software. SkyView MicrowaveTM provides engineers with the ability to design Microwave and Broadband Networks directly in Google EarthTM with accurate and repeatable results.

Unlike traditional microwave engineering programs that produce a static paper plot, SkyView MicrowaveTM permits the designer to view and analyze path clearance and Line of Sight relative to terrain and obstructions in 3D, with the ability to make immediate path changes if required. With SkyView MicrowaveTM, the user can design radio paths which can be viewed at different angles anywhere in the world. The Software also offers a choice of towers and antennas in 3D that provides a truly accurate representation of the actual path between two sites. SkyView MicrowaveTM also produces accurate path Link Budgets and a complete technical record of the equipment and specifications in a microwave or broadband radio network. Because they're self contained, the GoogleTM Earth KMZ files created in SkyView Microwave can be emailed or shared via the web with clients, engineers, site acquisition, construction and operational personnel who can easily and simply retrieve and display all site and path engineering data within the project.

Designed for wireless carriers, vendors and integrators, SkyView MicrowaveTM is an affordable engineering software tool that offers customers a unique and practical way to design, view and share their Microwave or Broadband Radio Paths.

SkyView Software Development, LLC, is a Subsidiary of 4G Unwired, Inc. and the developers of a suite of Google Earth-based *SkyViewTM* RF Mapping services, 3D Engineering Software tools and custom GIS applications.

About 4G Unwired, Inc.

4G Unwired (4G) is an RF Engineering consulting firm that provides wireless RF system design, network optimization and advanced technical training. We design the latest 4G access technologies for LTE, UMTS, WiMAX, AWS and 700 MHz networks in addition to providing expertise to carriers and vendors on their GSM, CDMA, In-Building and microwave networks. www.4GUnwired.com
